

# Lecture #11: Conservation Laws Continued

L #11.1

## Conservation of momentum Maxwell Stress Tensor

Let us first consider electrostatic forces:  $\vec{F}_E = \int \rho \vec{E} d^3x$

$$\Rightarrow \vec{F}_E = \int d^3x \left( \frac{\vec{\nabla} \cdot \vec{E}}{4\pi} \right) \vec{E} \Rightarrow F_i = \frac{1}{4\pi} \int d^3x (\partial_j E_j) E_i$$

$$= \frac{1}{4\pi} \int d^3x \left[ \partial_j (E_j E_i) - E_j \partial_j E_i \right]$$

Statics  $\vec{\nabla} \times \vec{E} = 0 \Rightarrow \frac{\partial E_i}{\partial x_j} = \frac{\partial E_j}{\partial x_i}$

$$\Rightarrow F_i = \frac{1}{4\pi} \int d^3x \left[ \partial_j (E_j E_i) - \frac{1}{2} \partial_i (E_j E_j) \right]$$

$$= \frac{1}{4\pi} \int d^3x \partial_j \left[ E_j E_i - \frac{1}{2} \delta_{ij} |\vec{E}|^2 \right]$$

Define Maxwell Stress tensor:

$$\hat{T} = \frac{1}{4\pi} (\vec{E} \vec{E} - \frac{1}{2} \hat{I} E^2)$$

Symmetric

$$\Rightarrow \vec{F}_E = \int d^3x (\vec{\nabla} \cdot \hat{T}) = \oint da \hat{n} \cdot \hat{T}$$

$-\hat{T} \cdot \hat{n} da =$  Force transmitted across  $\hat{n} da$   
(not force on  $\hat{n} da$ )  
*cause  $\hat{n}$  outward*

Flux of a vector is a tensor

$\hat{n} \parallel \vec{E} \Rightarrow \hat{T} \cdot \hat{n}$  along  $\vec{E} \Rightarrow$  transmits a pull

$\hat{n} \perp \vec{E} \Rightarrow \hat{T} \cdot \hat{n}$  along  $-\hat{n} \Rightarrow$  transmits a push

Magnetostatics,  $\vec{\nabla} \cdot \vec{B} = 0$        $\vec{\nabla} \times \vec{B} = 4\pi \vec{J}$

$$\Rightarrow \vec{F} = \int \left( \frac{\vec{J}}{c} \times \vec{B} \right) d^3x = \frac{1}{4\pi} \int \left[ (\vec{\nabla} \times \vec{B}) \times \vec{B} \right] d^3x$$

$$\begin{aligned} \Rightarrow F_i &= \frac{1}{4\pi} \int \epsilon_{ijk} (\vec{\nabla} \times \vec{B})_j B_k = \frac{1}{4\pi} \int \epsilon_{ijk} \epsilon_{jlm} \partial_l B_m B_k d^3x \\ &= \frac{1}{4\pi} \int (\delta_{il} \delta_{km} - \delta_{im} \delta_{kl}) (\partial_l B_m B_k) d^3x \\ &= \frac{1}{4\pi} \int (\partial_k B_i B_k - \frac{1}{2} \partial_i |\vec{B}|^2) d^3x \\ &= \frac{1}{4\pi} \int \partial_k \left[ B_k B_i - \frac{1}{2} \delta_{ik} |\vec{B}|^2 \right] d^3x \end{aligned}$$

$$\Rightarrow \vec{F} = \int \vec{\nabla} \cdot \vec{T}_B d^3x = \oint d\vec{a} \cdot \vec{T}$$

where  $\vec{T}_B = \frac{1}{4\pi} (\vec{B} \vec{B} - \frac{1}{2} \hat{1} |\vec{B}|^2)$

Total Maxwell- Stress-Tension

$$\vec{T} = \frac{1}{4\pi} (\vec{E} \vec{E} + \vec{B} \vec{B}) - \frac{(E^2 + B^2)}{8\pi} \hat{1}$$

$\vec{T}$  not so useful in statics, but important in dynamics

Generally:  $d\vec{F} = -da\vec{e}_n \cdot \vec{T}$  is the force transmitted by the field across the area normal to  $\vec{e}_n$

Consider an arbitrary surface element  $da = \vec{e}_n da$  and the local field at that point

### Facts

- (i)  $d\vec{F}$  is in the plane containing  $\vec{E}$  and  $\vec{e}_n$
- (ii) Angle between  $\vec{E}$  and  $\vec{e}_n$  = Angle between  $d\vec{F}$  and  $\vec{E}$
- (iii)  $|d\vec{F}| = \frac{|\vec{E}|^2}{8\pi} da \Rightarrow \frac{|\vec{E}|^2}{8\pi} = \text{electrostatic pressure}$

Example: Coulomb's Law via Stress Tensor

To find force on  $q_2$  we will calculate flux of  $\vec{T}$  through close hemisphere, radius  $R$

$$\Rightarrow \vec{F} = \oint_{\text{hemisphere}} d\vec{a} \cdot \vec{T} = \int_{\text{disk}} d\vec{a} \cdot \vec{T} + \int_{\text{dome}} d\vec{a} \cdot \vec{T}$$

L#11.3

The calculation is easiest with  $R \rightarrow \infty$

On dome  $da \sim \frac{1}{R^2}$  whereas  $T \propto |E|^2 \propto \frac{1}{R^4}$

$$\Rightarrow \lim_{R \rightarrow \infty} \int_{\text{dome}} d\vec{a} \cdot \vec{T} \rightarrow 0$$

$$\Rightarrow \vec{F} = \int_{\text{disk}} d\vec{a} \cdot \vec{T}$$

on disk  $\vec{E} \perp \vec{e}_n \Rightarrow d\vec{a} \cdot \vec{T} = -\vec{e}_n \frac{|\vec{E}|^2}{8\pi} da$

On the disk,  $|\vec{E}|$  is azimuthally symmetric, depending only on the cylindrical radius  $\rho$

$$|\vec{E}(\rho)| = 2 \frac{q}{R^2} \cos\theta = 2 \frac{q \cos\theta}{R^3} = \frac{2q\rho}{(\rho^2 + \frac{d^2}{4})^{3/2}}$$

$$da = 2\pi\rho d\rho$$

$$\Rightarrow \vec{F} = -\vec{e}_n \int_0^\infty \rho d\rho \frac{|\vec{E}|^2}{4} = -\vec{e}_n q^2 \int_0^\infty \frac{\rho^3}{(\rho^2 + \frac{d^2}{4})^3} d\rho$$

$$= -\vec{e}_n q^2 \left[ \frac{-d^2 + 8\rho^2}{16(\rho^2 + \frac{d^2}{4})^2} \right]_0^\infty = -\vec{e}_n \frac{q^2}{d^2}$$

Coulomb's Law !

Conservation of momentum in E&M

Newton's Law of action - reaction

$$\vec{F} \Big|_{\text{fields on sources}} = - \vec{F} \Big|_{\text{sources on fields}}$$

$$\Rightarrow \frac{d\vec{P}}{dt} \Big|_{\text{sources}} = - \frac{d\vec{P}}{dt} \Big|_{\text{fields}}$$

$$\Rightarrow \frac{d\vec{P}}{dt} \Big|_{\text{fields}} = - \int d^3x \left( \rho(\vec{x}, t) \vec{E}(\vec{x}, t) + \frac{\vec{J}(\vec{x}, t)}{c} \times \vec{B}(\vec{x}, t) \right)$$

Thus, we interpret

$$\vec{R}_{\vec{p}} = - \left( \rho(\vec{x}, t) \vec{E}(\vec{x}, t) + \frac{\vec{J}(\vec{x}, t)}{c} \times \vec{B}(\vec{x}, t) \right)$$

= Rate of creating momentum in field  
Volume

Consider now  $\vec{\nabla} \cdot (-\vec{T}) =$  local flow of momentum in field

$$-\vec{T} = \left( \frac{E^2 + B^2}{8\pi} \right) \hat{1} - \frac{1}{4\pi} (\vec{E} \vec{E} + \vec{B} \vec{B})$$

$$\left( \vec{\nabla} \cdot (-\vec{T}) \right)_i = \partial_j (-T_{ji})$$

$$= \partial_i \left( \frac{E^2 + B^2}{8\pi} \right) - \frac{1}{4\pi} \left[ \partial_j (E_j E_i) + \partial_j (B_j B_i) \right]$$

Asides:

$$\left[ \begin{aligned} \partial_i \left( \frac{E^2 + B^2}{8\pi} \right) &= \frac{1}{8\pi} \partial_i (E_j E_j + B_j B_j) = \frac{1}{4\pi} (E_j \partial_i E_j + B_j \partial_i B_j) \\ \partial_j (E_j E_i + B_j B_i) &= E_i (\vec{\nabla} \cdot \vec{E}) + E_j \partial_j E_i \\ &\quad + B_i (\vec{\nabla} \cdot \vec{B}) + B_j \partial_j B_i \end{aligned} \right.$$

$$\begin{aligned} \therefore (\vec{\nabla} \cdot (-\vec{T}))_i &= \frac{1}{4\pi} (-E_i (\vec{\nabla} \cdot \vec{E}) - B_i (\vec{\nabla} \cdot \vec{B}) \\ &\quad + E_j (\partial_i E_j - \partial_j E_i) \\ &\quad + B_j (\partial_i B_j - \partial_j B_i)) \end{aligned}$$

Aside:

$$\left[ \begin{aligned} E_j (\partial_i E_j - \partial_j E_i) &= E_j \epsilon_{ijk} (\vec{\nabla} \times \vec{E})_k = -(\vec{E} \times (\vec{\nabla} \times \vec{E}))_i \\ &\text{and similarly for } \vec{B} \end{aligned} \right.$$

$$\begin{aligned} \therefore \vec{\nabla} \cdot (-\vec{T}) &= \frac{1}{4\pi} (-\vec{E} (\vec{\nabla} \cdot \vec{E}) - \vec{B} (\vec{\nabla} \cdot \vec{B}) \\ &\quad + \vec{E} \times (\vec{\nabla} \times \vec{E}) + \vec{B} \times (\vec{\nabla} \times \vec{B})) \end{aligned}$$

Now use Maxwell's Equations:

$$\vec{\nabla} \cdot \vec{E} = 4\pi\rho$$

$$\vec{\nabla} \times \vec{E} = -\frac{1}{c} \frac{\partial \vec{B}}{\partial t}$$

$$\vec{\nabla} \cdot \vec{B} = 0$$

$$\vec{\nabla} \times \vec{B} = \frac{4\pi}{c} \vec{J} + \frac{1}{c} \frac{\partial \vec{E}}{\partial t}$$

L#11.6

$$\Rightarrow \vec{\nabla} \cdot (-\vec{T}) = -\rho \vec{E} + \vec{E} \times \left( \frac{1}{4\pi c} \frac{\partial \vec{B}}{\partial t} \right) + \vec{B} \times \frac{\vec{J}}{c} + \vec{B} \times \left( \frac{1}{4\pi c} \frac{\partial \vec{E}}{\partial t} \right)$$

$$\vec{\nabla} \cdot (-\vec{T}) = -\rho \vec{E} - \frac{\vec{J}}{c} \times \vec{E} - \frac{1}{4\pi c} \frac{\partial}{\partial t} (\vec{E} \times \vec{B})$$

$\Rightarrow$  Conservation of momentum

$$\frac{\partial \vec{g}}{\partial t} + \vec{\nabla} \cdot (-\vec{T}) = \vec{R}_p$$

$$\vec{g} = \frac{1}{4\pi c} \vec{E} \times \vec{B} = \frac{1}{c^2} \int = \text{momentum density in field}$$

$$\vec{T} = \left( \frac{E^2 + B^2}{8\pi} \right) \hat{1} - \frac{1}{4\pi} (\vec{E} \vec{E} + \vec{B} \vec{B})$$

= momentum flux density of field

$$\vec{R}_p = -(\rho \vec{E} + \frac{\vec{J}}{c} \times \vec{B}) = \text{rate of creation of momentum in field}$$

L#11.7

## Angular Momentum Conservation

Let  $\vec{L}$  = angular momentum of source

$$\frac{d\vec{L}_{\text{source}}}{dt} = \int d^3x \vec{x} \times \vec{f}(\vec{x}) = \int d^3x \vec{x} \times \left( \rho(\vec{x}, t) \vec{E}(\vec{x}, t) + \frac{\vec{J}(\vec{x}, t)}{c} \times \vec{B}(\vec{x}, t) \right)$$
$$= -\frac{d\vec{L}_{\text{field}}}{dt}$$

$$\Rightarrow -\vec{x} \times \vec{f}(\vec{x}) = -\vec{x} \times \left( \rho \vec{E} + \frac{\vec{J}}{c} \times \vec{B} \right) = \vec{x} \times \vec{R}_p$$

$= \vec{R}_L$  = rate of creation of angular momentum in field volume

$$\Rightarrow \left[ \frac{\partial}{\partial t} (\vec{x} \times \vec{g}) + \vec{\nabla} \cdot (-\vec{x} \times \vec{T}) \right] = \vec{R}_L$$

Angular momentum density in field:  $\vec{L} = \vec{x} \times \vec{g} = \vec{x} \times \left( \frac{\vec{E} \times \vec{B}}{4\pi c} \right)$

Flux density of angular momentum:

$$-\vec{x} \times \vec{T} = \text{a big mess!}$$
